As users of 1/3 of the nation’s energy, manufacturers depend on an affordable and reliable energy supply to remain competitive in a global economy. Manufacturers support an energy strategy that embraces all forms of domestic energy production while expanding existing conservation and efficiency efforts. Oil, natural gas and clean coal remain essential contributors to America’s energy security, but we also must invest in other energy sources such as nuclear, alternative fuels, renewable energy, and energy efficiency. America must expand access to our domestic energy supply in order to meet current needs for affordable energy.

Manufacturers also continue to lead the way in investing in energy efficiency and advancing sustainability efforts that positively impact manufacturing and the industry’s contributions to environmental protection, economic performance and the social well-being of the employees, communities, customers and consumers they serve.

- Affordable Energy Campaign
- Carbon Tax
- Environmental Regulation
  - Chemical Regulations
  - Greenhouse Gas Regulations
  - Ozone Regulations
  - Petroleum Coke
  - Water Regulations
- Keystone XL
- Sustainability
